Fully Open Source Code Platform

- Join us in developing tools and strategies to democratise financial investment
- We believe that now is the time given advancements in hardware, AI, fintech and financial instruments
- Contribute to tools like free robo-advisers and see how we can disrupt this space together

Motivation: “A rising tide lifts all boats” ... while that means shit all if you don’t have any boats.

Mission: Build more boats. Condor’s mission is to increase access to and engagement in the financial investment market place and to do so in a way that increases stable, mid- to long-term investments. This is not a casino.

Point of Difference: Condor Funds is focused on the middle to lower income consumers and the 40% of Americans that do not own a single investment. Our success is gauged by that number going down.

% Stock	Yes	No
US Adults	61	38
By Income		
\$100k+	84	16
\$40k-\$100k	63	36
< \$40k	29	71

Why use investment to build wealth in middle class?

Historically stocks and other common investments
Increase over time

The Top US Large Cap Stocks
(S&P500) over the last 50 years.

Major US Small Cap Stocks (Russell
2000) over the last 40 years.

Leading Gold ETF over the last
25 years

Why use investment to build wealth in middle class?

One example investment: a popular passive index fund over the last 16 years would have lead to 150 to 300 percent returns, which is about 13% annually - much better than a savings account.

We want to find the disconnect

How?

The Market Place

Consumer sentiment

Whats missing? ...the tools.

- Suggestions and speculation abound - the (so called) hot tip is out there
- Trading platforms are out there (and some are even free)
- Accessible financial instruments are out there (e.g. low cost exchange traded funds)
- Education is out there (although find key info in a digestible format for all is harder)
- But, the rigorous, easy-to-use **tools** to build a diversified portfolio **are not**

Learning that meets you where you are

Fully open source code platform

- Opportunities - it is now easier to invest responsibly than ever before:
 - Financial instruments like low fee ETFs
 - Financial services like low to no commission trading platforms
- Condor software and development notes are open source
- Code in Python heavily leveraging objects and projects in Jupyter Notebooks
- We lean to an open community of developers through code repositories like GitHub
- Built on virtual environments and containers like Anaconda and Docker
- Initial launch on Amazon Web Services

S&P 500 with Exponential Guidelines

Historical data on the S&P 500 Index, which is made up of about 500 major US stocks. Indices like this, and the famous Dow Jones, are commonly looked at to determine overall US Stock Market health, but you cannot buy them directly. Although it goes through years long lows and highs, it typically trends upward over-time.

There are certain funds that you can buy like regular stocks that try to mimic the overall US stock market by mimicking the S&P 500 index portfolio, like the S&P 500 Exchange Traded Fund (ETF) Trust (NYSE ticker SPY). These are considered 'passive' ETFs because they are easy to manage - they follow an index - keeping cost down (typical fees are less than 00.1%). These ETFs let you follow an index smoothly without having to buy and manage all underlying the stocks, like buying lots of small pieces in a single purchase.

- ConocoPhillips (COP)

Suggest

Portfolio:

Data Forecast

Using past data, we can estimate your reward and risk for each of your chosen assets. By combining your assets in different ways, we can make possible portfolios that try to maximize your reward depending on how much risk you want to take - Efficient Frontier. We can also make a 'reasonable guess' for a well-balanced portfolio - Tangent Portfolio - based on risk free assets, like US Treasury Bills.

The Button for 'Forecast'

Using past data, we can make a forecast - a reasonable guess - on what an asset or whole portfolio might be at different times using a forecasting algorithm. We could start from 2 years ago and compare the algorithm's past guess to what actually happened (providing trust in the algorithm) or we could start from today and just see the forecast for the next 2 years (helping to plan and manage expectations). We can also estimate how confident we are (the chances we think the algorithm is reliable).

Check out our more functional [Portfolio Forecaster](#)

Technical details on the [forecasting algorithm](#)
